Executive Summary

LICENSE

1464
vCPU

The Splunk license calculation is based on the total vCPU across all server environments, while the current purchased capacity is 1,464 vCPUs.

HOW TO ACCESS?

Secure Connection

Access Portal

portal.example.com

Ensure the user is registered in Splunk and has been assigned to the appropriate role or group, either under Security or Operations.

Identity Provider Authentication

ESCALATION FLOW

For cases or incidents occurring within the Splunk environment that are handled by the L2 team based on the RACI matrix, Please contact the designated Point of Contact (PoC).

ACTIVITY TICKET

Create and Modify User Access Splunk

478

Integrate and Modify Log Apps

316

Integrate and Update SSL Certificate on IOT Apps

1

The total number of tickets within the last one year was 795 tickets, consisting of 478 tickets for Create and Modify User Access Splunk, 316 tickets for Integrate and Modify Log Apps, and 1 ticket for Integrate and Update SSL Certificate on IoT Apps.

EVENT / INCIDENT

INVENTORY

During the reporting period, the platform supported security monitoring, operational troubleshooting and incident investigation activities across multiple integrated systems.

splunk® >

Security Monitoring Platform is a platform that enables organizations to collect, index, search, analyze, and visualize data from various IT and business infrastructure components — including data from servers, applications, network devices, security systems, sensors, and cloud services — transforming complex machine data into actionable and easy-to-understand insights. After the data is collected Splunk Enterprise indexes and parses it into searchable events, allowing users to leverage a web interface or the Search Processing Language (SPL) to perform searches, analysis, dashboard creation, visualizations, real-time monitoring, alerting, and reporting to support operational needs, troubleshooting, security, and compliance.

OVERVIEW

SPLUNK ENTERPRISES

👍 **Deployer**

Used in a Search Head Cluster environment to distribute apps, configurations, and knowledge objects to all Search Head members.

👍 **Cluster Master (Cluster Manager)**

Manages the Indexer Cluster, including data replication, maintaining data availability, and ensuring all indexers in the cluster remain synchronized and healthy.

👍 **Monitoring Console**

Used to monitor the health and performance of the entire Splunk environment, including resource usage, indexing rate, search performance, and the status of other Splunk components.

👍 **Indexer**

Responsible for receiving data from forwarders, processing and indexing that data, and storing it so it can be searched quickly when queries are performed.

👍 **Search Head**

Used by users to perform searches, create dashboards, reports, and visualizations. The Search Head sends search queries to the indexers and presents the results.

👍 **Deployment Server**

Distributes configurations, apps, and updates to multiple Splunk Forwarders from a central point.

COMPONENT OF SPLUNK

The Security Monitoring environment is used to collect, search, and analyze logs from security platforms such as firewalls, endpoint protection solutions, and web security systems. This Search Head is dedicated exclusively to handling security-related logs from security solutions such as Firewalls, Web Application Firewalls (WAF), Extended Detection and Response (XDR), and other security platforms. Its primary objective is to support threat monitoring, security investigations, incident response, and operational visibility

SPLUNK SECURITY

splunk>

SPLUNK ENTERPRISES

The Operations Monitoring environment is used to collect, search, and analyze logs from business applications, infrastructure services, and operational systems. The platform supports troubleshooting, service monitoring, performance analysis, and operational reporting activities.

INVENTORY

SPLUNK ENTERPRISES

Currently, there are **multiple apps** and **indexes** that have been integrated and are managed by **Security Monitoring Platform**

Daily Task:

- ✓ Monitor platform health and performance
- ✓ Review operational alerts
- ✓ Manage user access requests
- ✓ Support log source onboarding
- ✓ Maintain platform configurations
- ✓ Assist incident investigation activities

MANAGED APPS/INDEXES AND DAILY TASK

**THANK
YOU**
